

On the 100th anniversary of Marconi's successful experiment on radio broadcasting, 250 astronomers from all over the world met in Bologna (Italy) for five days, to update their knowledge of the physics and statistical properties of powerful extragalactic radio sources. Since their discovery in the fifties enormous progress has been made. The existence of superluminal motions in the cores of radio sources, the presence there of a black hole surrounded by an absorbing dust torus, as inferred mostly from studies at other wavelengths, are now accepted ideas. Nevertheless, in spite of these efforts, there are many questions still unanswered. For instance we do not know which mechanism produces the huge amount of energy supplied to radio sources, how the jets connecting the engine to the lobes are formed and collimated, which of the differences observed among the various classes of radio sources are apparent and which are real. These and other related topics are discussed in this book.

Using Technical Analysis (The Investors self-teaching seminars), Quantum Optics for Engineers, Agency Operations and Sales Management-Agency Management Tools and Processes-Segment C, Continuous Martingales and Brownian Motion (Die Grundlehren der Mathematischen Wissenschaften), 30 Easy Things to Cook and Eat (Cooking Cards),

**Classification of extragalactic radio sources** There is an NRAO workshop proceedings volume dealing with this point (Physics of Energy Transport in Extragalactic Radio Sources, 1984, ed. A.H. Bridle and **Planck intermediate results - XLV. Radio spectra of northern Jets**. Long before celestial radio sources were dreamed of, an optical jet was seen in the nebula M 87 (Curtis 1918).
